

Application No. 09/938,893  
Amendment dated September 5, 2006  
Reply to Office Action of June 23, 2006

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Previously Presented) A scan window apparatus for indicating a scan window within a member of a scanning device, the member having a first side and a second side intersecting the first side, comprising:

a scan window definition device including a plurality of moveable position markers configured to move along the first side and the second side of the member; and

a scan window illumination device, wherein at least one of the plurality of moveable position markers includes a light source on the at least one of the plurality of markers and configured to direct light into at least one of the sides of the member.

2. (Previously Presented) The scan window apparatus of claim 1, and wherein the member comprises an essentially transparent platen defined by a first surface on which an object to be scanned can be placed, and an opposite second surface.

3.-6. (Canceled)

7. (Previously Presented) The scan window apparatus of claim 1, wherein:  
the member includes a transparent platen having a top surface and a bottom surface; and

Application No. 09/938,893  
Amendment dated September 5, 2006  
Reply to Office Action of June 23, 2006

the light sources configured to direct light into at least one of the sides of the member are located proximate to the first side and the second side to allow the light to enter the platen between the top surface and the bottom surface.

8. (Previously Presented) The scan window apparatus of claim 7, wherein the platen is impregnated with light reflective particles oriented to reflect light from the light sources configured to direct light into at least one of the sides of the member, but to allow light from a scanning light source to freely pass through the platen from the bottom surface to the top surface.

9. (Currently Amended) A scan window apparatus for indicating a scan window within a scanable surface of a scanning device, the scanable surface having a first edge and a second edge intersecting the first edge and an upper side and a lower side, comprising:

a scan window definition device to allow a user to define the scan window on the scanable surface; and

a scan window illumination device including a light source configured to generate a focused beam of light to trace at least part of a perimeter of the scan window by directing the focused beam of light toward at least one of the upper side and the lower side of the scanable surface.

10. (Previously Presented) The scan window apparatus of claim 9, wherein the scan window definition device comprises a plurality of moveable position markers configured to move along the first edge and the second edge of the scanable surface and thereby define the scan window, the scan window apparatus further comprising a plurality of position detectors configured to detect the positions of the plurality of position markers along the first and second edges of the scanable surface and to generate position signals in response thereto, and wherein the scan window apparatus is configured to use at least one of the position signals to direct the focused beam of light.

Rev. 12/05

Application No. 09/938,893  
Amendment dated September 5, 2006  
Reply to Office Action of June 23, 2006

11. (Previously Presented) The scan window apparatus of claim 9, further comprising an oscillating mirror, wherein the focused beam of light is generated by a laser and is directed by the oscillating mirror to trace at least a part of the perimeter.

12. (Previously Presented) The scan window apparatus of claim 9, further comprising a rotating polygonal-sided mirror, wherein the focused beam of light is generated by a laser and is directed by the rotating polygonal-sided mirror to trace at least a part of the perimeter.

13. (Currently Amended) An optical scanning device comprising:  
a platen defining a scanable surface, the platen comprising an essentially transparent surface defined by an upper side and a lower side, the scanable surface being defined by a first edge and a second edge orthogonal to the first edge;  
a scanning light source configured to optically scan an object placed proximate the upper side of the platen, the scanning light source being located proximate the lower side of the platen,  
a scan window definition device to allow a user to define a scan window on the platen to be scanned by the scanning light source; and  
a scan window illumination device ~~configured to define the scan window with a perimeter, the scan window illumination device comprising a light source configured to generate a focused beam of light to trace at least part of [[the]] a~~  
perimeter of the scan window by directing the focused beam of light toward at least one of the upper side and the lower side of the platen.

14. (Canceled)

Application No. 09/938,893  
Amendment dated September 5, 2006  
Reply to Office Action of June 23, 2006

15. (Currently Amended) The optical scanning device of claim 13, wherein the ~~scan window definition device~~ scanning light source includes the scan window illumination device and is configured to direct the focused beam of light.
16. (Currently Amended) The optical scanning device of claim 13, ~~further comprising wherein the scan window illumination device includes~~ a back-lighting light source positioned to direct light to the lower side of the platen.
17. (Previously Presented) The optical scanning device of claim 15, and wherein the scan window definition device comprises a plurality of moveable position markers configured to move along the first and second edges of the scanable surface and thereby define the scan window.
18. (Previously Presented) The optical scanning device of claim 15, and wherein the scan window definition device comprises a user interface allowing a user to identify positions along the first edge and the second edge of the scanable surface to thereby define the scan window.
19. (Previously Presented) The optical scanning device of claim 13, further comprising an oscillating mirror, wherein the focused beam of light is generated by a laser and wherein the oscillating mirror is configured to direct the focused beam of light to trace at least a part of the perimeter.
20. (Previously Presented) The optical scanning device of claim 13, further comprising a rotating polygonal-sided mirror, wherein the light source comprises a laser, and wherein the rotating polygonal-sided mirror includes a configuration to direct the focused beam of light to trace at least a part of the perimeter.
21. (Currently Amended) A method of identifying a scan window to be scanned as part of a scanable surface, comprising:

Application No. 09/938,893  
Amendment dated September 5, 2006  
Reply to Office Action of June 23, 2006

defining the scan window by generating signals to define at least a portion of a perimeter of the scan window for tracing; and

tracing the at least a portion of [[a]] the perimeter of the scan window on the scanable surface using by directing at least one focused beam of light based on the generated signals.

22.-26. (Canceled)

27. (Previously Presented) The method of claim 26, further comprising scanning only the scan window on the scanable surface.

28.-31. (Canceled)
